

The Physics of CMB Polarization

Wayne Hu

Why Measure the Polarization?

- Virtues of polarization
 - unlike temperature anisotropies, generated by scattering only
 - tensor field on the sky; carries more info than scalar temperature

Why Measure the Polarization?

- Virtues of polarization
 - unlike temperature anisotropies, generated by scattering only
 - tensor field on the sky; carries more info than scalar temperature
- Uses of polarization
 - verify the gravitational instability paradigm: fluctuations present during last scattering (outside horizon \Rightarrow inflation)
 - probe the reionization epoch: remove a leading source of ambiguity (degeneracy) in the temperature power spectrum
 - get higher statistics on the acoustic peaks and their underlying parameters

Why Measure the Polarization?

- Virtues of polarization
 - unlike temperature anisotropies, generated by scattering only
 - tensor field on the sky; carries more info than scalar temperature
- Uses of polarization
 - verify the gravitational instability paradigm: fluctuations present during last scattering (outside horizon \Rightarrow inflation)
 - probe the reionization epoch: remove a leading source of ambiguity (degeneracy) in the temperature power spectrum
 - get higher statistics on the acoustic peaks and their underlying parameters
 - reconstruct the scalar, vector, tensor nature of the perturbations and hence the cosmology even if ab initio models are wrong
 - test inflationary models by measuring the gravity wave amplitude: energy scale and shape of inflaton potential

Polarization from Thomson Scattering

- Differential cross section depends on polarization and angle

Polarization from Thomson Scattering

- Isotropic radiation scatters into unpolarized radiation

Polarization from Thomson Scattering

- Quadrupole anisotropies scatter into linear polarization

aligned with
cold lobe

Isotropization by Scattering

- Rock: polarization generated by Thomson scattering
- Hard Place: Thomson scattering destroys quadrupole source

Quadrupoles at Recombination's End

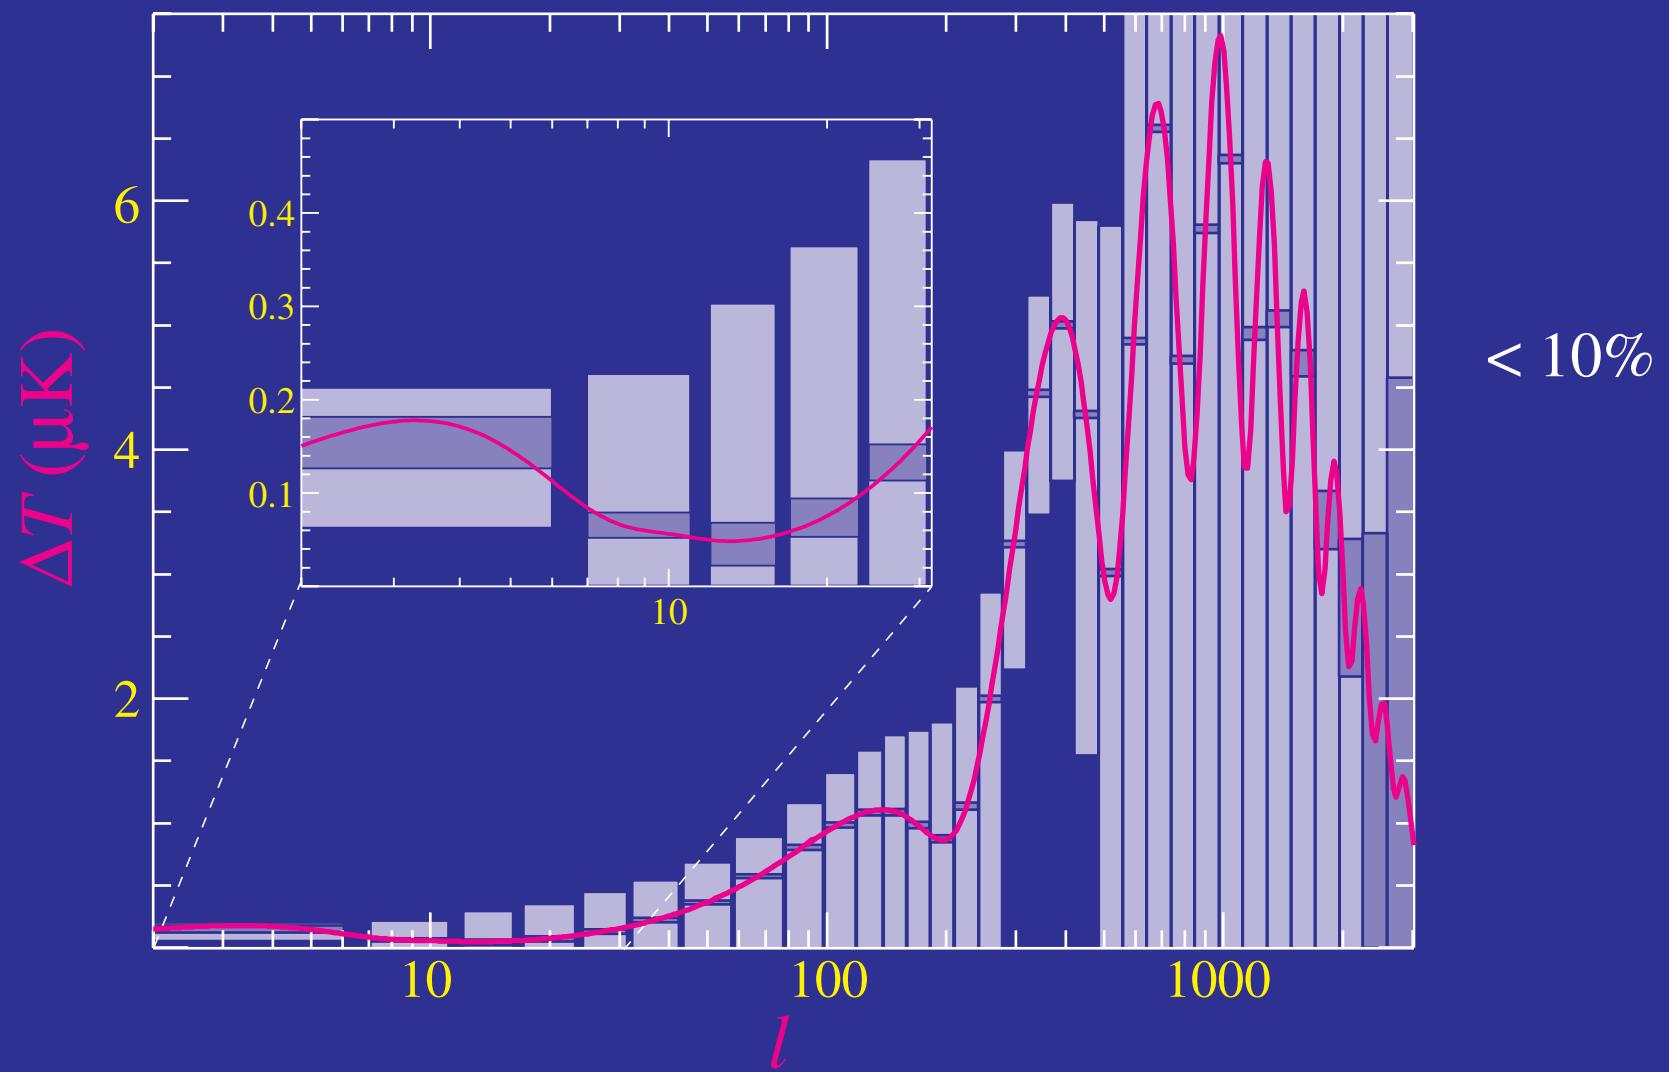

- Acoustic inhomogeneities become anisotropies by streaming/diffusion

Quadrupoles at Recombination's End

- Electron "observer" sees a quadrupole anisotropy
- Polarization pattern is a projection quadrupole anisotropy

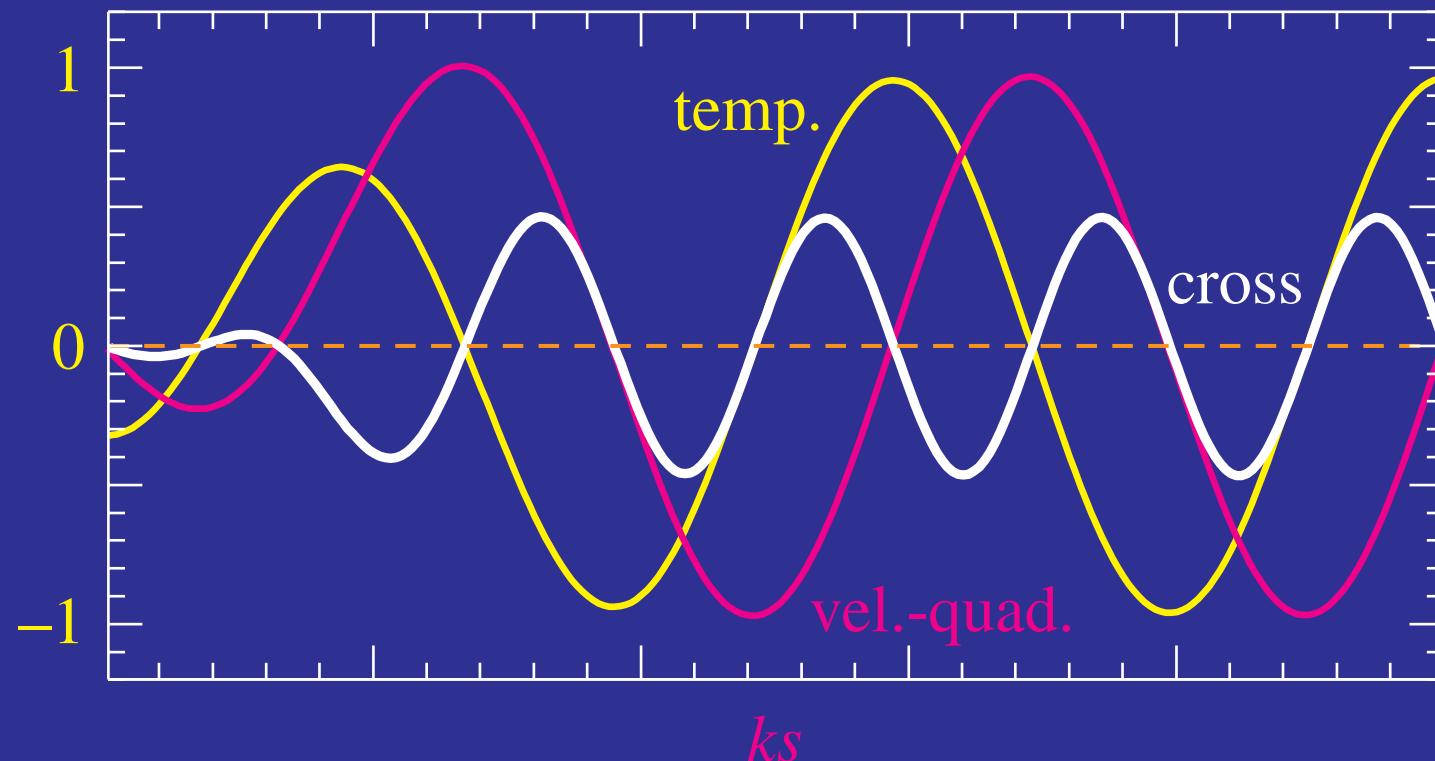

Polarization Power Spectrum

- Quadrupole generation on diffusion scale (optically thin regime)
- Primary peak coincides with beginning of damping tail $l \sim 1000$
- Secondary peak coincides with horizon scale at reionization $l < 10$

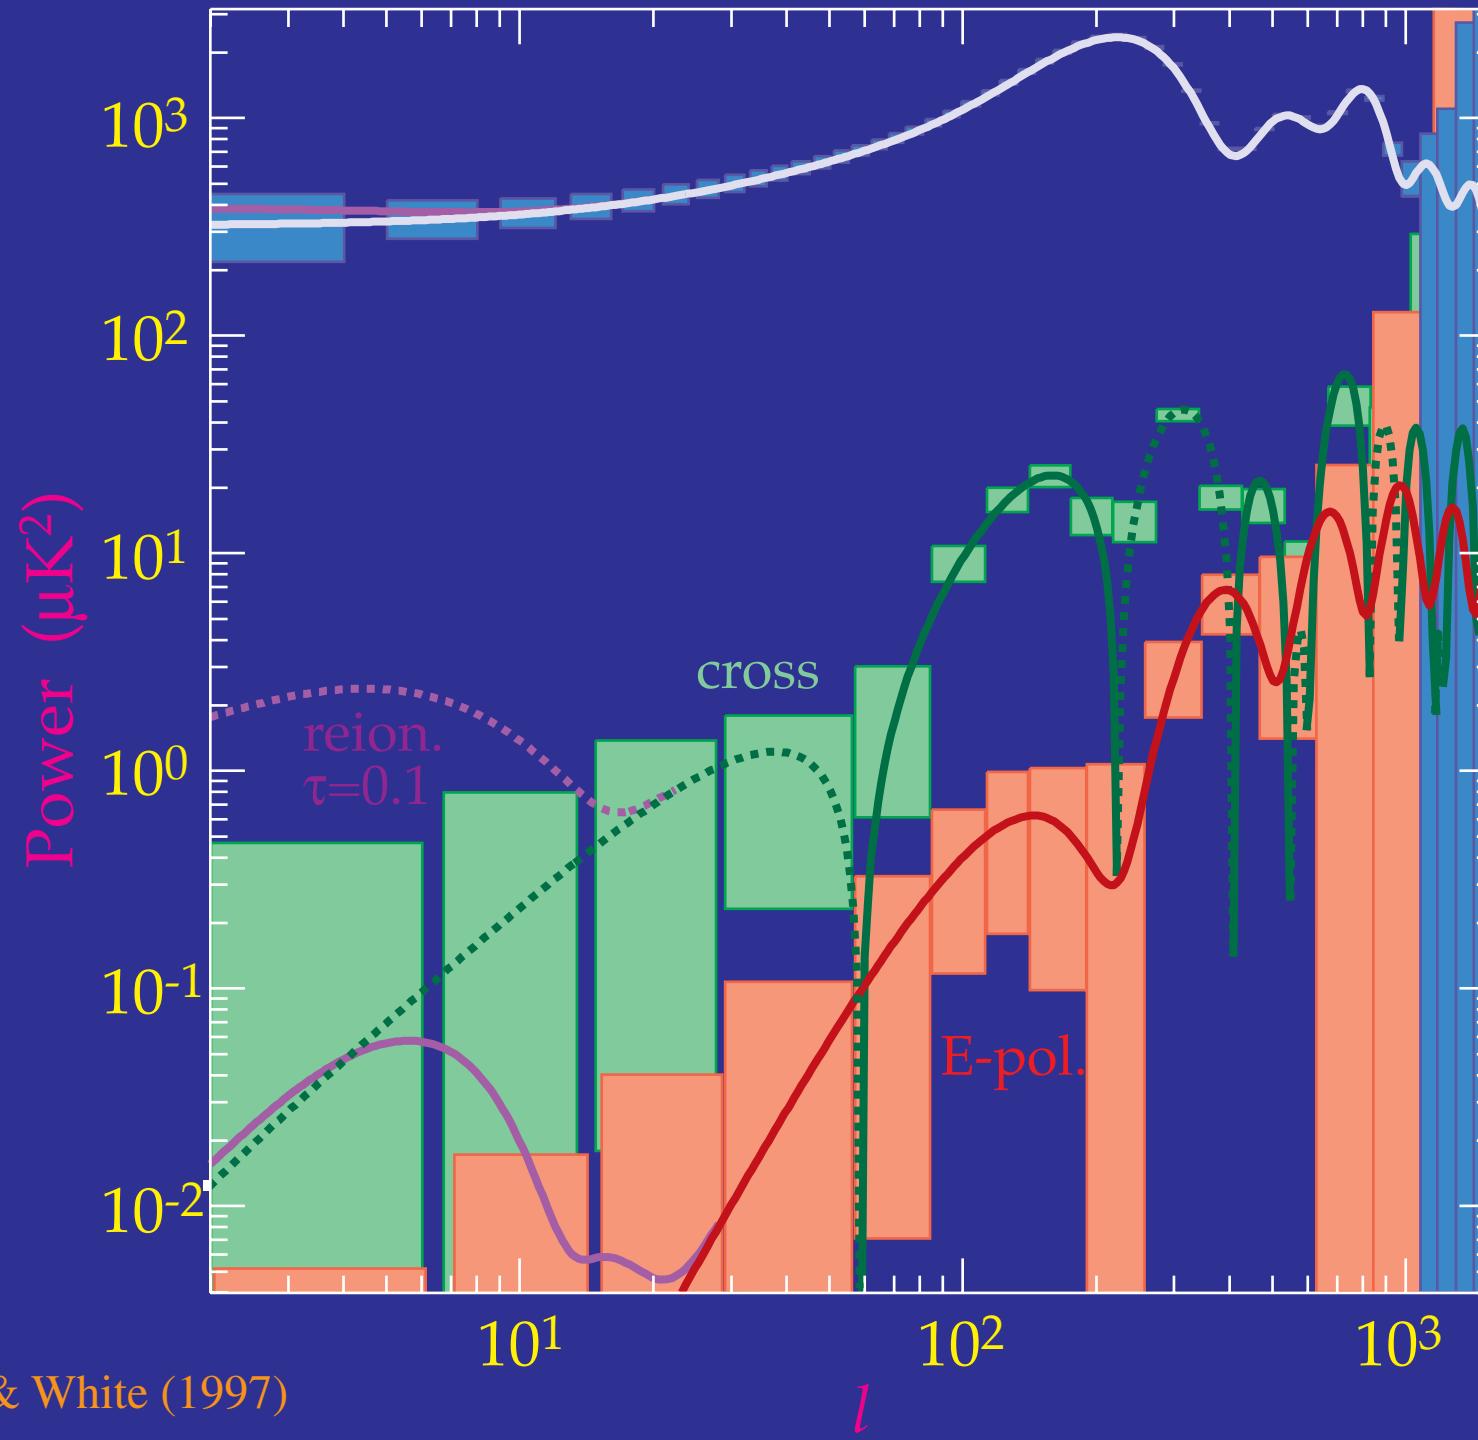

Acoustic Peaks in the Polarization

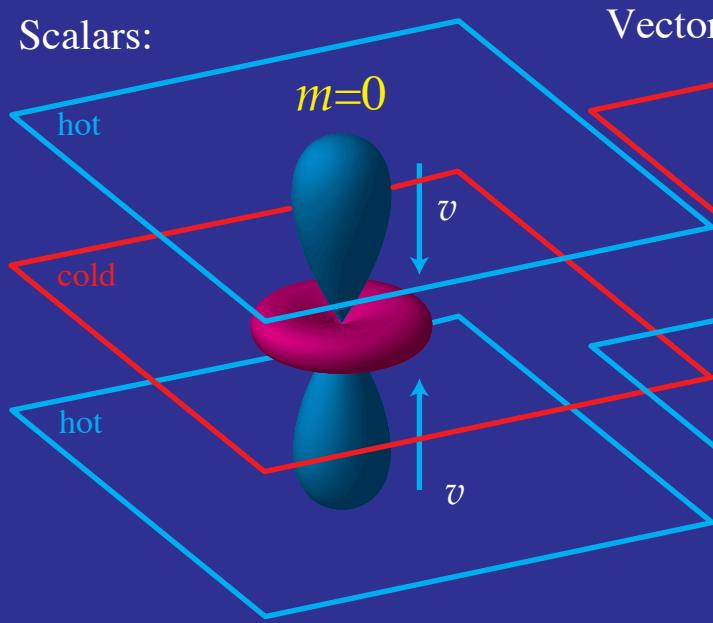

- Scalar quadrupole follows the velocity perturbation
- Acoustic velocity out of phase with acoustic temperature
- Correlation oscillates at twice the frequency

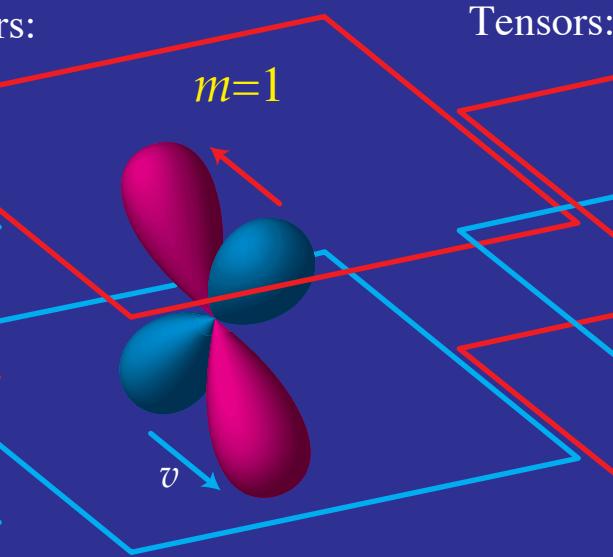

Scalar Power Spectra

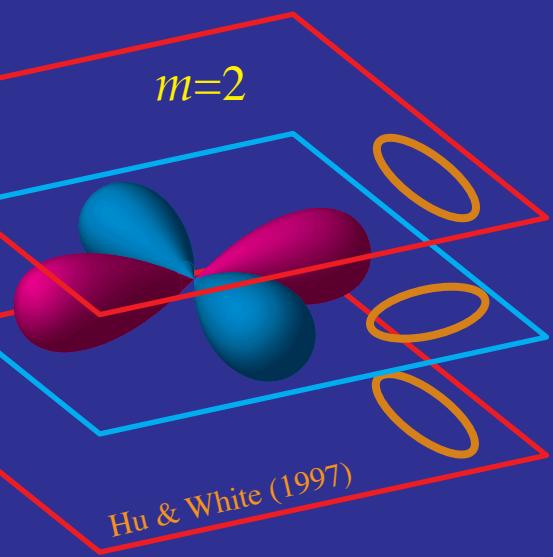

Scalars:

Vectors:

Tensors:

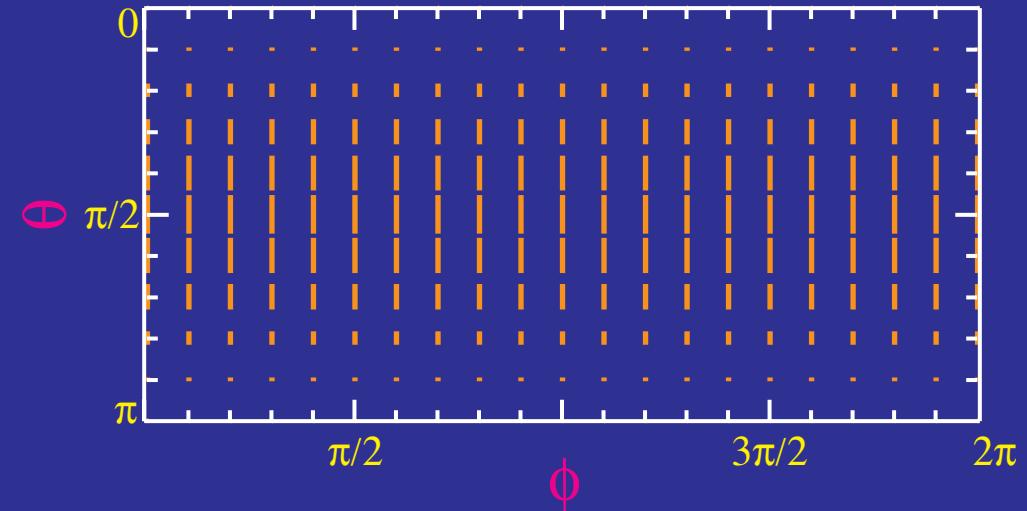

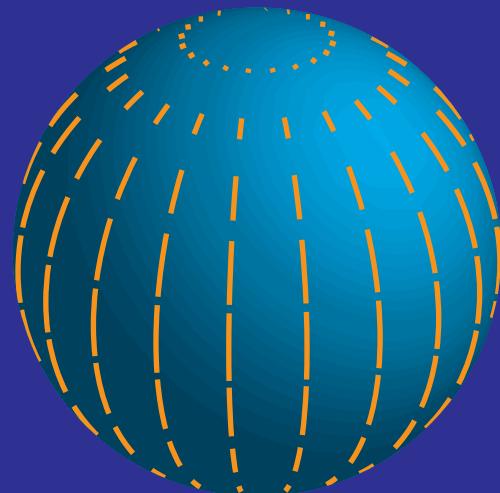

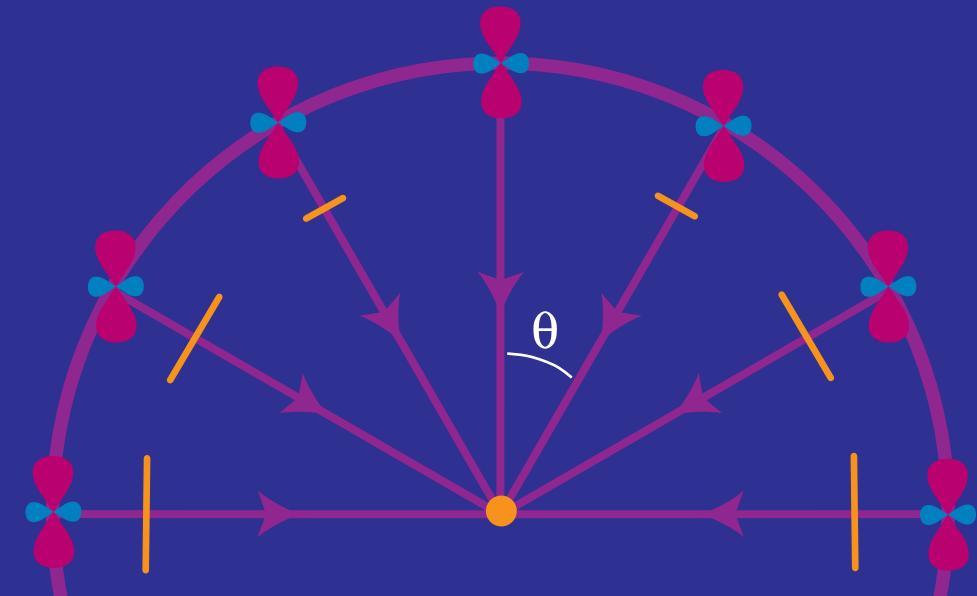

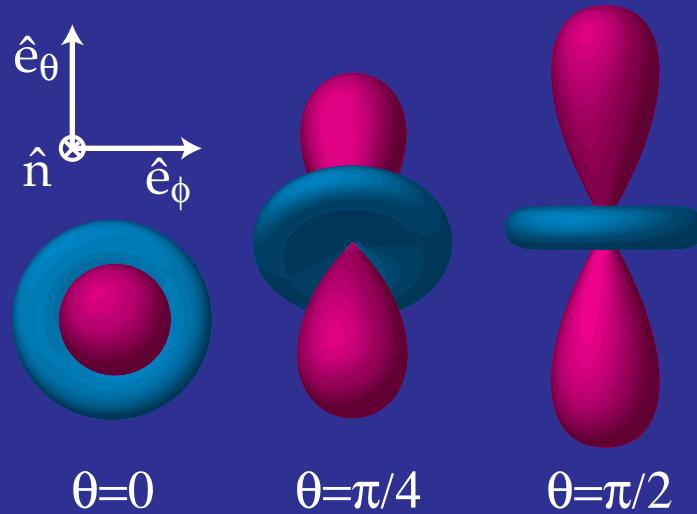

Polarization on the Sphere

- Polarization direction oriented with the cold lobe of the quadrupole
- A local observer will see a $\sin^2\theta$ pattern of Q -polarization: spin-spherical harmonic: $l=2, m=0, s=2$: ${}_2Y_2^0$.

Polarization on the Sphere

- Polarization is a projection of the quadrupole moments

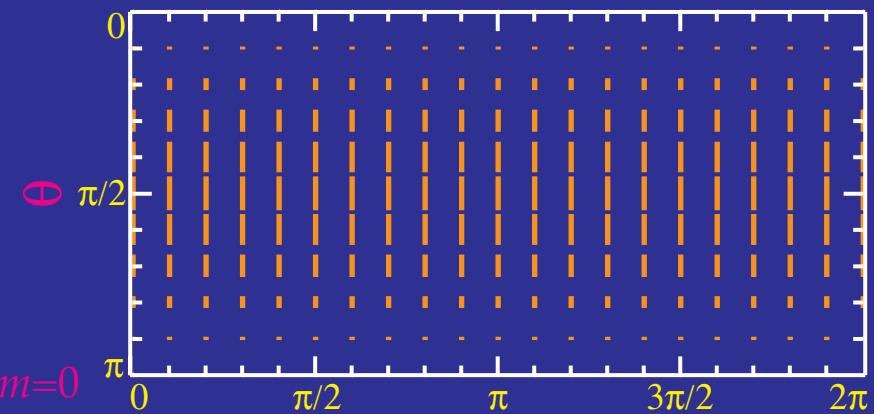

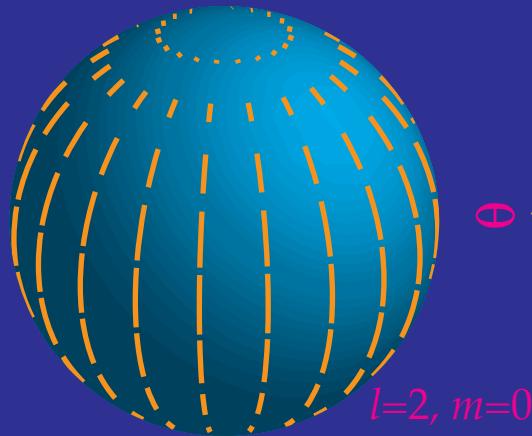

Polarization on the Sphere

- Polarization due to gravitational waves follows similarly
- $m=\pm 2$ quadrupole viewed at different angles

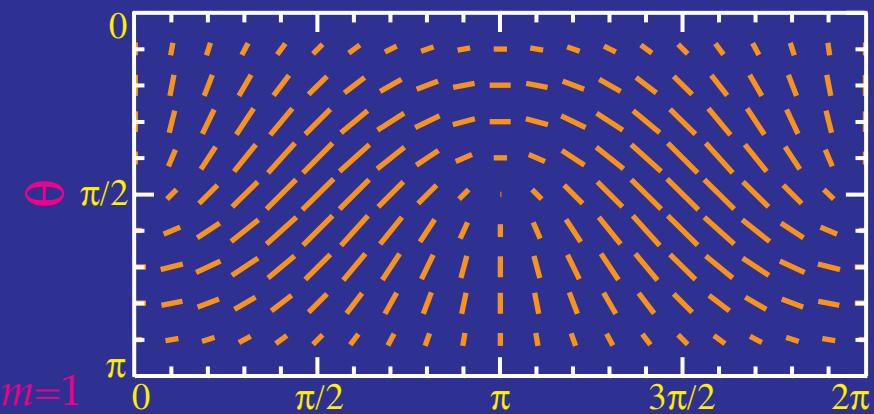

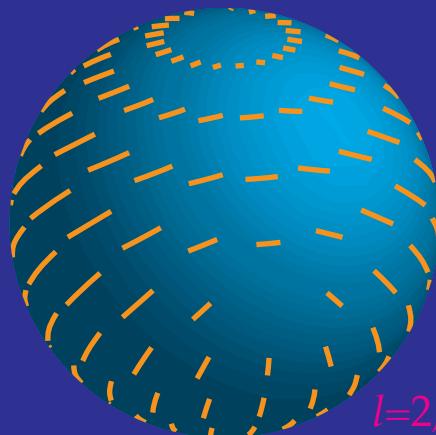

- Difference: no symmetry – Q and U polarization
- Coordinate independent description of polarization

Polarization Patterns

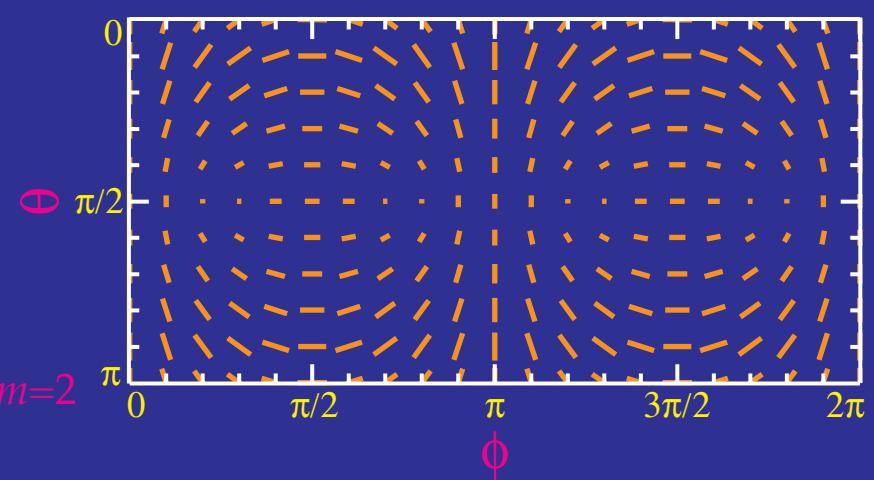

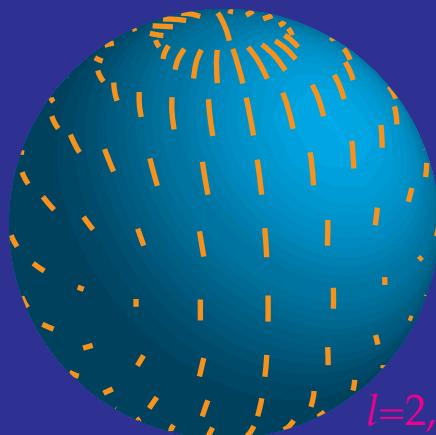

Scalars

Vectors

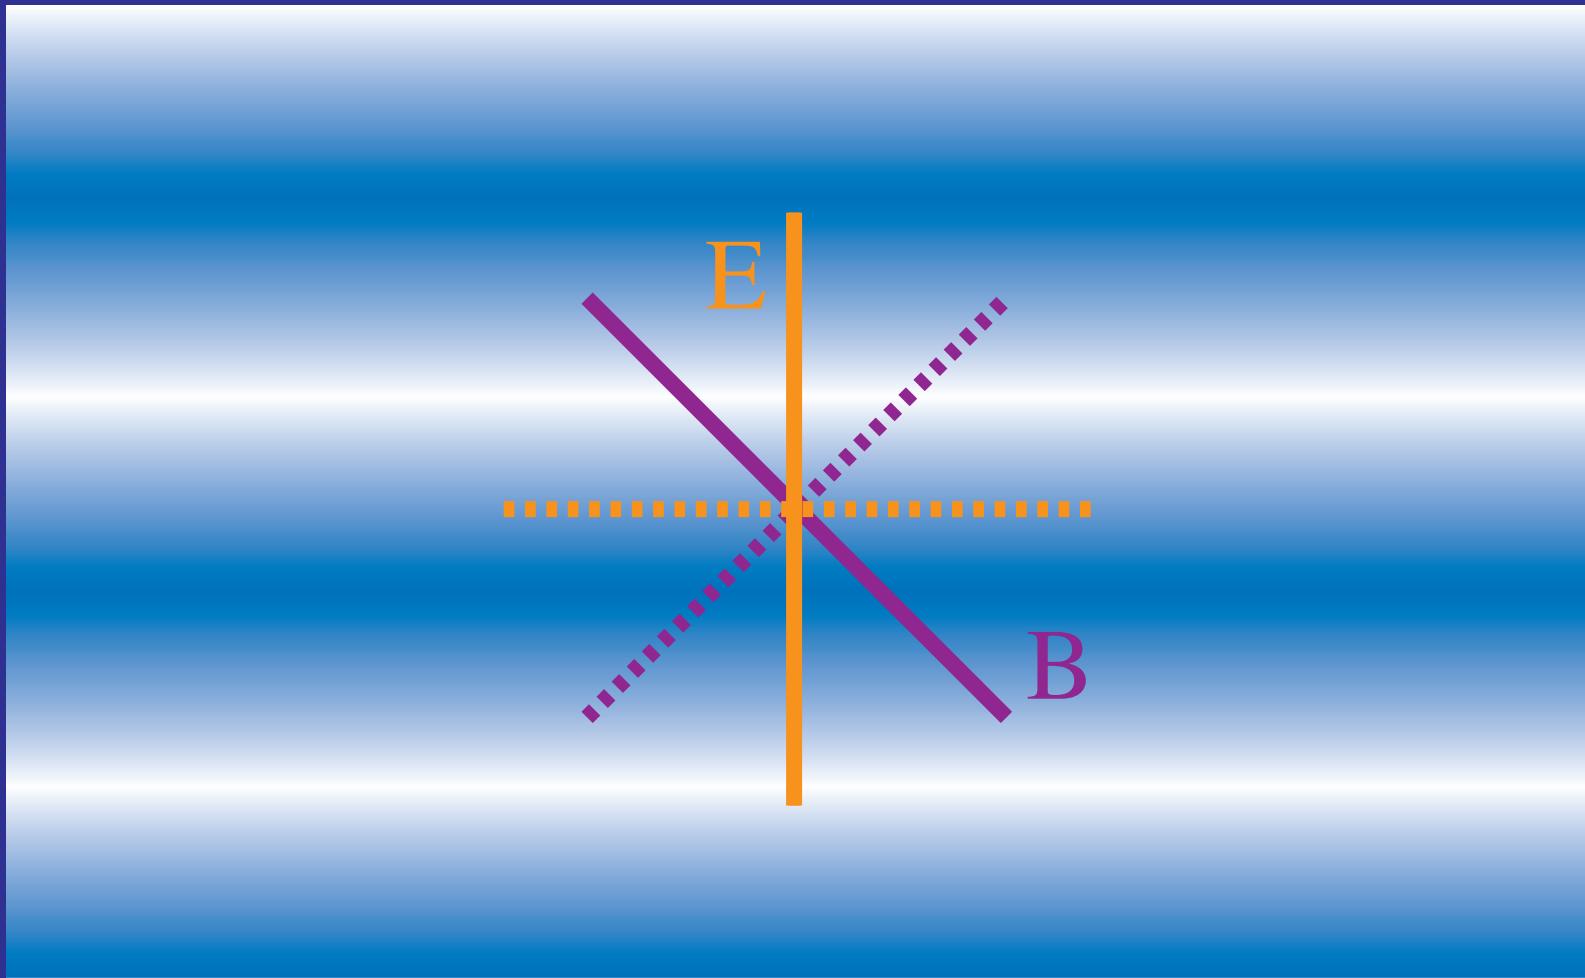

Tensors

Electric & Magnetic Polarization

(a.k.a. gradient & curl)

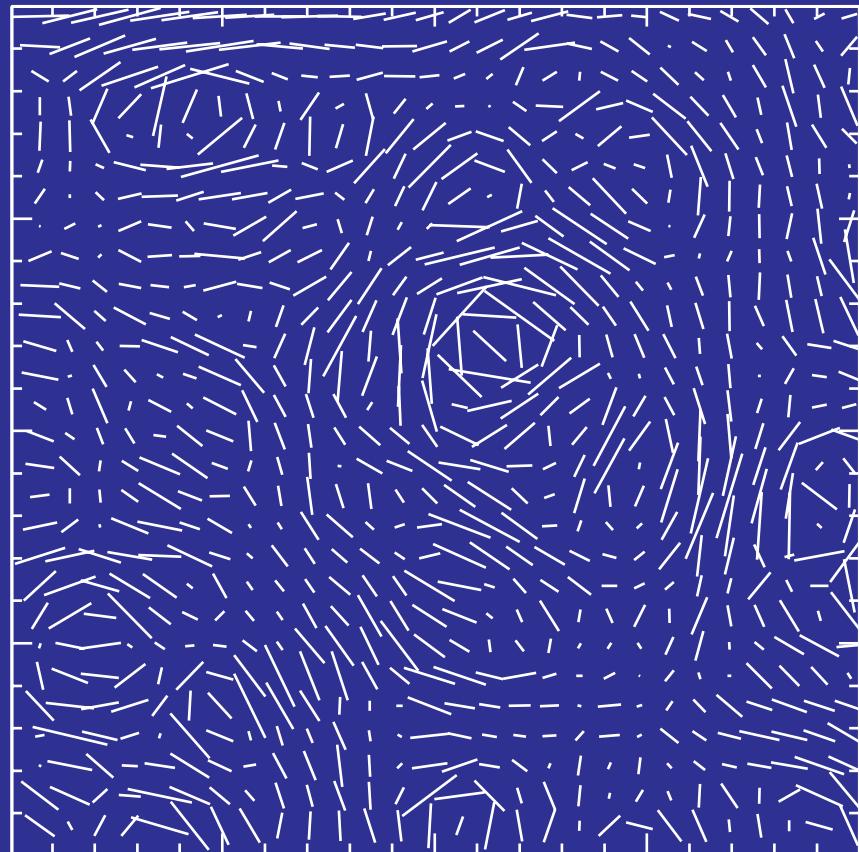

- Alignment of principal vs polarization axes
(curvature matrix vs polarization direction)

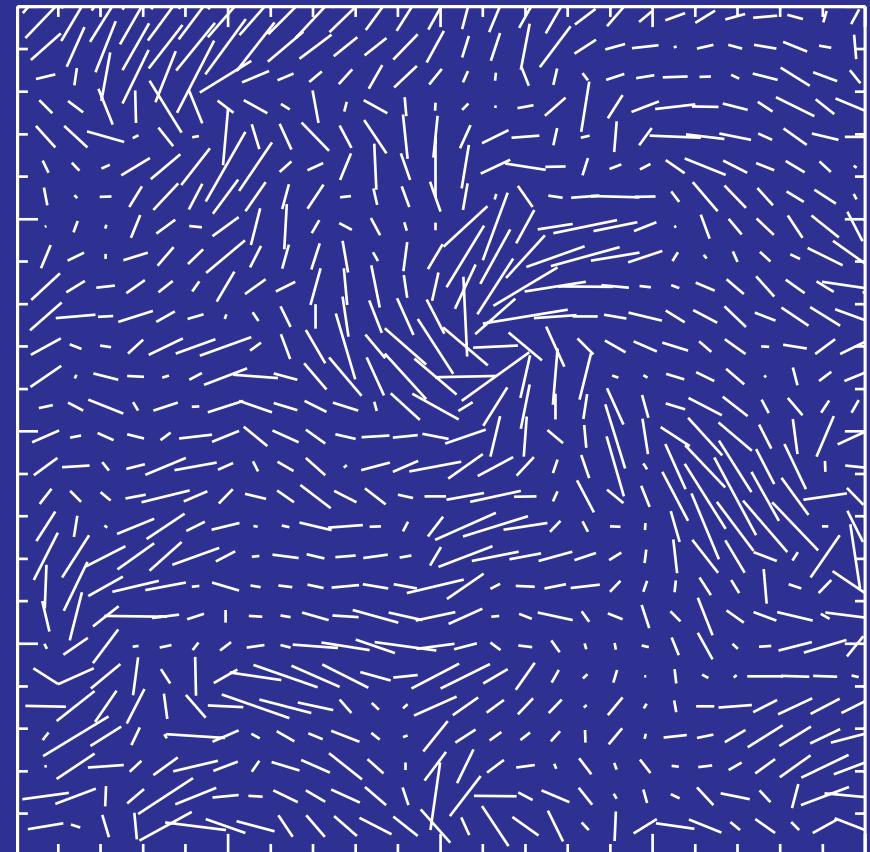

Kamionkowski, Kosowsky, Stebbins (1997)

Zaldarriaga & Seljak (1997)

Polarization Patterns

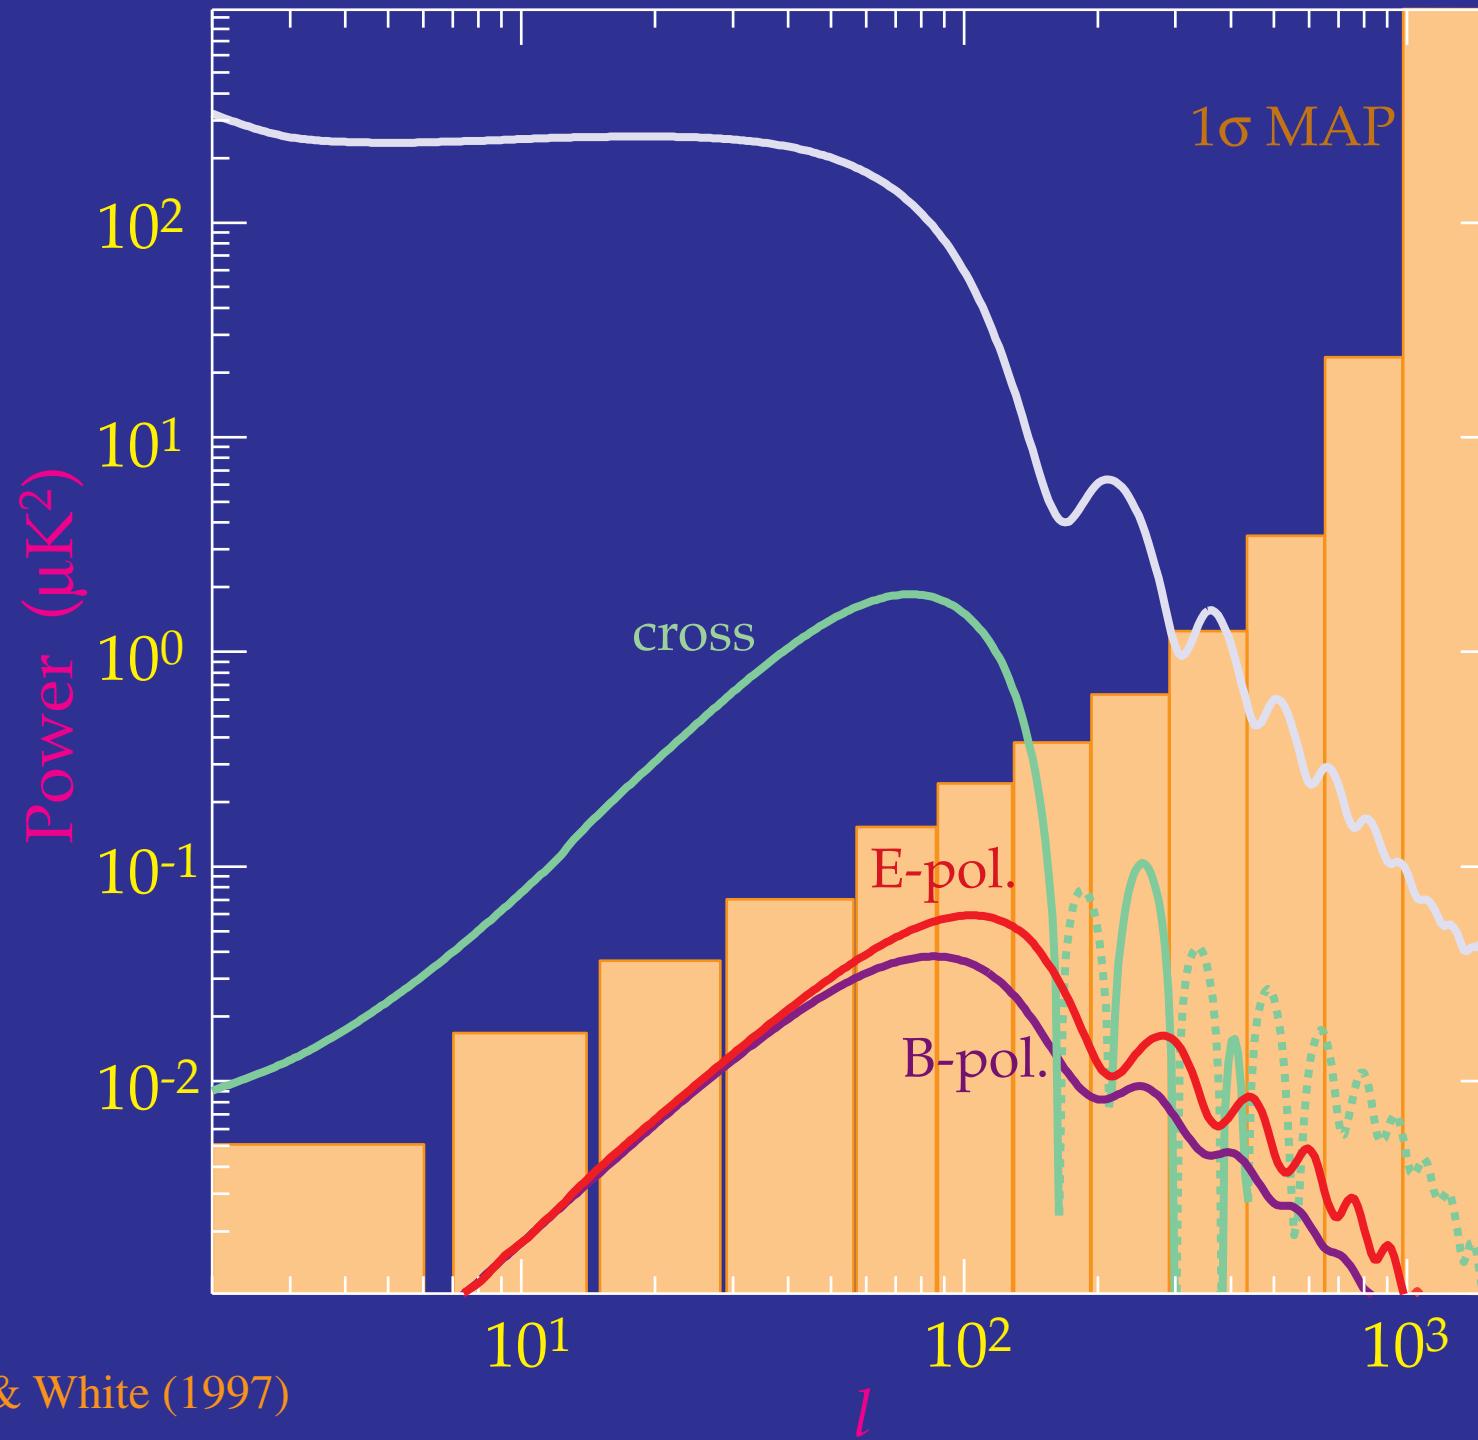

E-polarization

B-polarization

Tensor Power Spectra

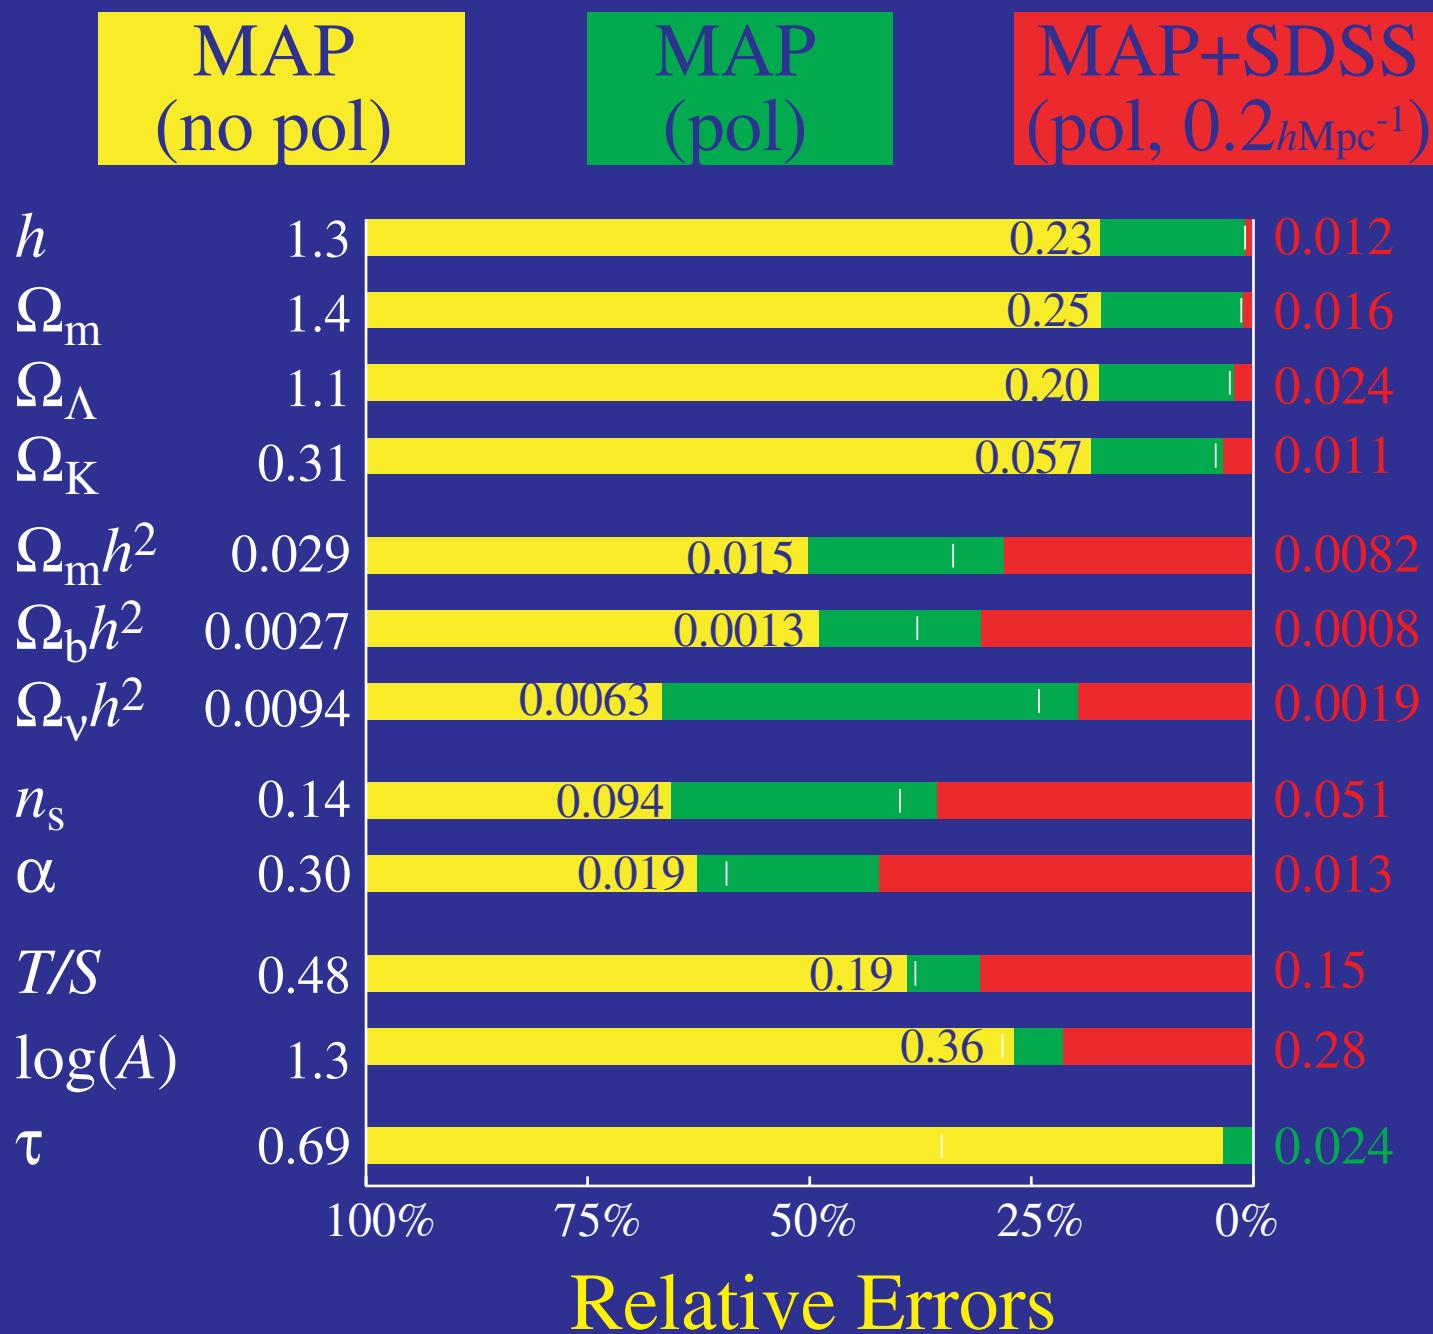

Hu & White (1997)

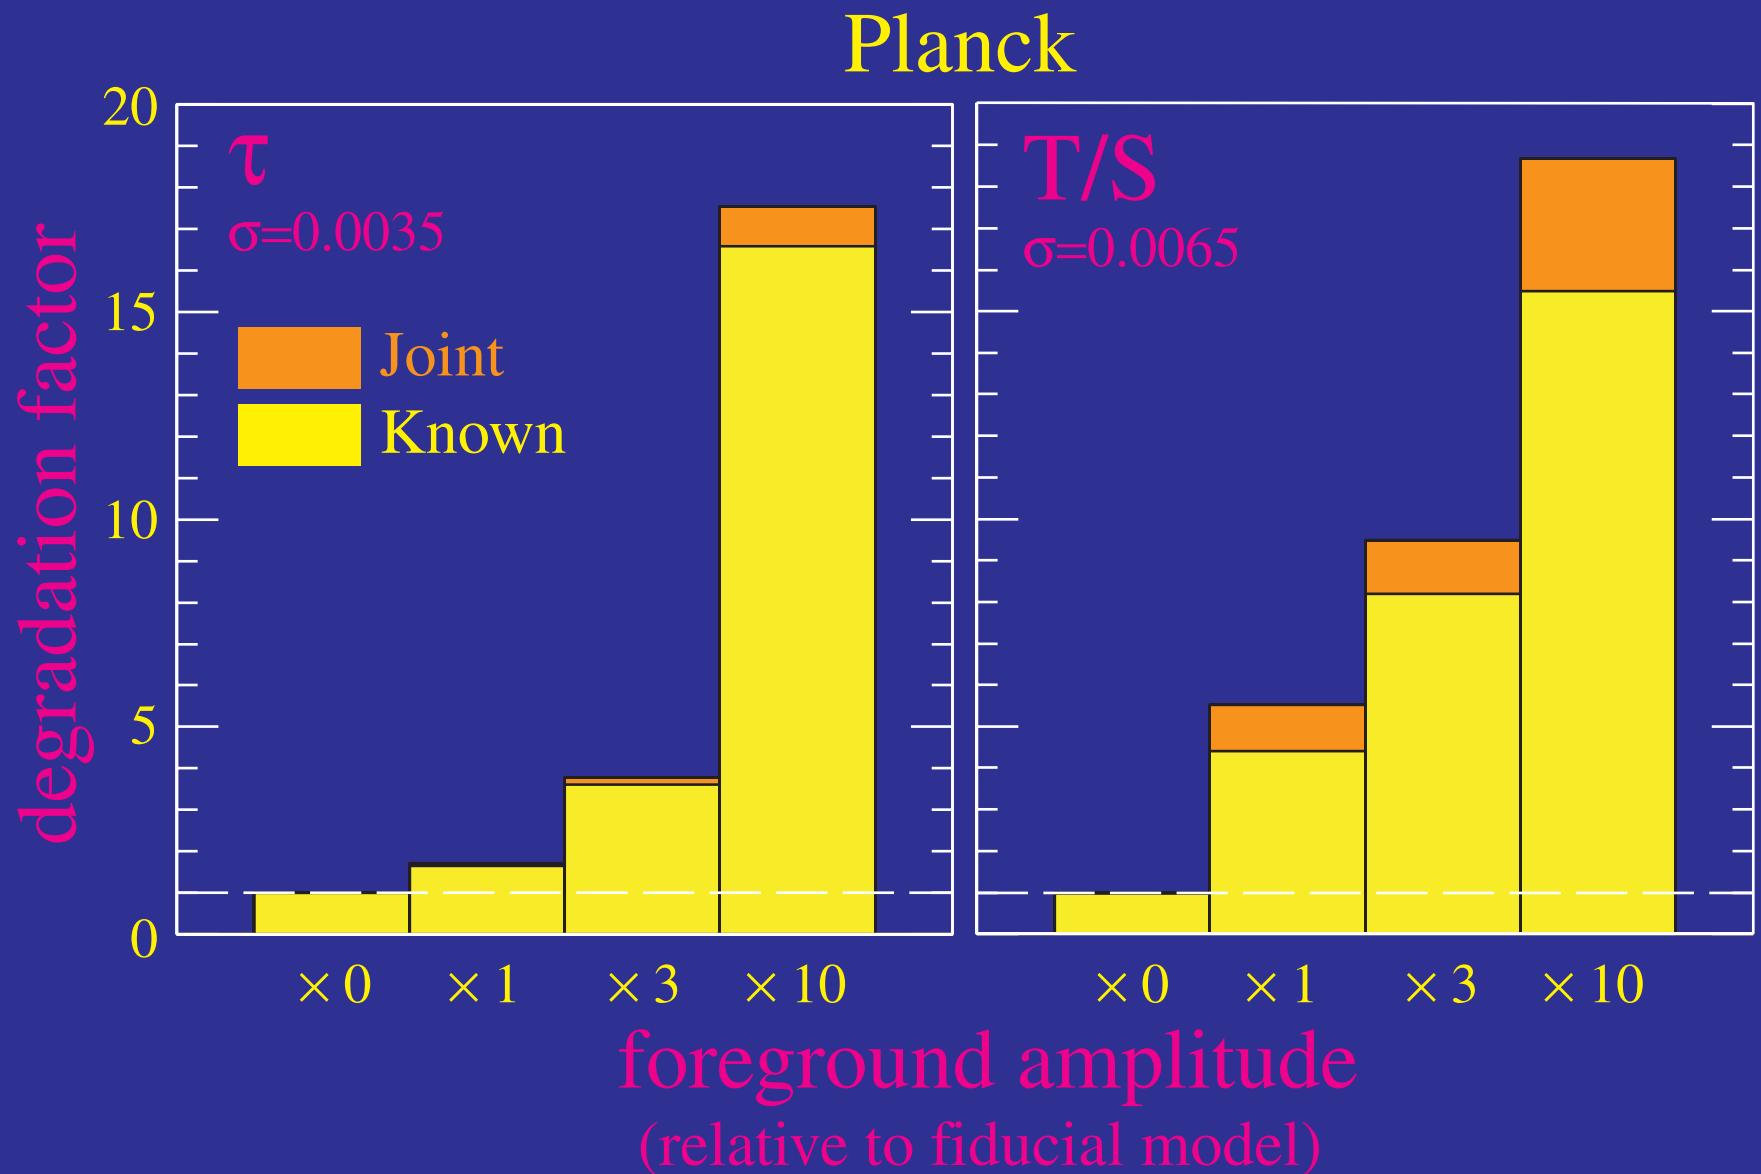

Reionization and Gravitational Waves

- Distinguished by polarization power spectrum (B-modes)

Polarization and Parameter Estimation

Foregrounds & Parameter Estimation

B-modes from Secondaries

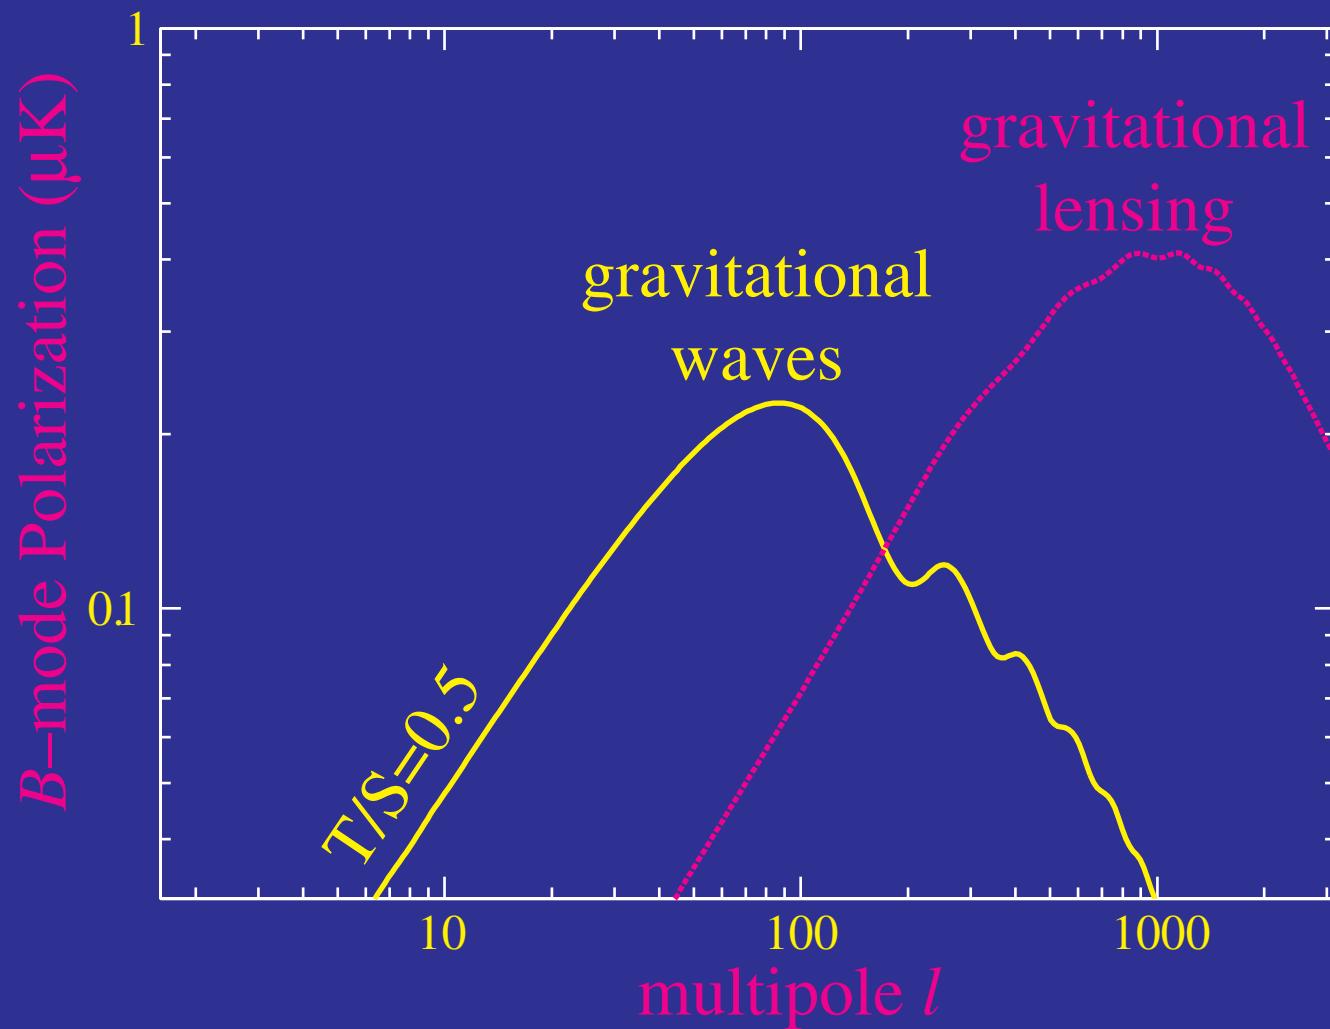

- Beyond linear theory, density fluctuations generate B-modes
- Secondary gravitational and scattering processes

B-modes from Secondaries

- Beyond linear theory, density fluctuations generate B-modes
- Secondary gravitational and scattering processes

B-modes from Secondaries

- Gravitational lensing is a foreground for gravitational waves
- B-modes can be used to map the dark matter

Summary

- Polarization is hard!

Summary

- Polarization is hard! (unavoidable consequence of generation by scattering in an optically thin environment)
- Anisotropies are $< 10\%$ polarized $\Rightarrow 10^{-6}$ or μK level
- Polarization pattern traces the quadrupole anisotropy at last scattering

Summary

- Polarization is hard! (unavoidable consequence of generation by scattering in an optically thin environment)
- Anisotropies are $<10\%$ polarized $\Rightarrow 10^{-6}$ or μK level
- Polarization pattern traces the quadrupole anisotropy at last scattering
- Acoustic oscillations in the polarization enhance precision of parameter estimation
- Secondary peak measures reionization epoch & breaks degeneracies
- B-modes probe gravitational waves from inflation

Summary

- Polarization is hard! (unavoidable consequence of generation by scattering in an optically thin environment)
- Anisotropies are $<10\%$ polarized $\Rightarrow 10^{-6}$ or μK level
- Polarization pattern traces the quadrupole anisotropy at last scattering
- Acoustic oscillations in the polarization enhance precision of parameter estimation
- Secondary peak measures reionization epoch & breaks degeneracies
- B-modes probe gravitational waves from inflation
- Foreground subtraction will likely be critical for B-modes
- Non-linear secondary anisotropies generate B-modes and need to be modeled
